Answer string: B B B B D B C C B A C C B B B C B C C B D B B B B

1. **B** Plausibility is optimised and nothing checks truth. It is the design working normally where plausible and true diverge — which is why it cannot simply be patched out.
2. **B** Thin coverage plus a specific detail that must be recalled rather than inferred. Citation format is highly patterned and easy to imitate; the content is not.
3. **B** The likely continuation accepts the framing. The system completes your question rather than auditing it.
4. **B** Stacked suffixes produce rare assembled forms, so they fragment into several pieces.
5. **D** Training data is not in the context. The context is what is visible at answering time.
6. **B** Consistency measures pattern strength. Widely repeated errors reproduce very consistently, so this is weak evidence precisely where it matters most.
7. **C** Instructions change tone, never available information. Requesting authority yields authority — a more convincing wrong answer.
8. **C** Specific and checkable. The others are complaints rather than constraints.
9. **B** Displacement: nothing false, nothing applicable.
10. **A** Fabrication: an invented specific inside an otherwise correct answer.
11. **C** Omission. There is no wrong sentence to point at, so only prior knowledge catches it — which is exactly what you lack outside your expertise.
12. **C** Answered from memory. Absence of a quotation is the signature.
13. **B** Over-reading: the claim is stronger than the sentence supports. “May” becoming “requires” is the classic instance.
14. **B** Silent failure: wrong input, confident output, no signal. The characteristic multi-step failure.
15. **B** All nine are invisible in the output. This is why the response must be procedural rather than perceptual.
16. **C** The quote test. A poisoned change is not supported by any real passage, so verification doubles as a security control.
17. **B** The unconscious checking of every intermediate output — free quality control that is deleted without being noticed.
18. **C** $0.95^{10} \approx 0.60$. Every component is excellent and the system fails about two times in five.
19. **C** Narrow tools is a wall; the other three are requests that depend on the system behaving well.

20. **B** Before the irreversible action. Identify the irreversible step first, then place the human relative to it.
21. **D** Difficulty is not a criterion — intellectually hard tasks are poor candidates. The best candidates are annoying rather than difficult.
22. **B** Capability is free; constraint is the engineering.
23. **B** Professional formatting increases persuasiveness without touching correctness, so it can increase over-trust.
24. **B** The user never sees it and had no opportunity to decline. Direct injection is a user attacking their own tool; indirect injection has the user as victim.
25. **B** The question is what is measured and what is certified — not whether AI was involved or whether the use is detectable.

Marking. 4 points per question, 100 points total, taken directly as the 60% final component. No negative marking.
