

Answer Key

Midterm Examination

Weeks 1–7 · 25 questions × 4 points = 100 points

Answer string: C B B C C B B B C B B B D B D D B B C B B B B B C

1. **C** Drafting produces new content. Ranking, flagging and detecting all select among existing options.
2. **B** Everything supplied is the prompt, including attachments — the basis for indirect injection in Week 12.
3. **B** Confidence stays flat while knowledge drops. There is no mechanism by which uncertainty could reach the output.
4. **C** Omission — everything present is true; the thing that mattered is absent. Hardest to catch because there is no wrong sentence to point at.
5. **C** Keyword matching and reflection only. No knowledge, no memory, no model of the conversation.
6. **B** Named in 1966 and still the most common error people make with these tools.
7. **B** The methods produced real working systems. Funding collapsed because of the promise-delivery gap, not technical failure.
8. **B** Stacked suffixes produce assembled words that appeared rarely, even though each piece is common.
9. **C** Turkish input is processed normally. The costs are context, money and coverage — not refusal.
10. **B** A probability distribution over the vocabulary, from which one token is selected.
11. **B** The same operation runs regardless of pattern strength. A near-certain answer and a guess are produced identically.
12. **B** Questions in training text are usually followed by answers, so refusal is a low-probability continuation. Fine-tuning shifts this tendency but installs no mechanism.
13. **D** Training data is not in the context. The context is what the model can see at the moment of answering.
14. **B** The quiet failure. An explicit error would be preferable, because it tells you something went wrong.
15. **D** The four levers are Context, Task, Format and Examples. Temperature is a sampling setting, not a lever of prompt design.
16. **D** Correct but lifeless means Examples. Stop describing the tone and show two paragraphs of the real thing.
17. **B** Compound tasks receive a shallow pass at each. Separate turns also let you verify each result before it is built upon.

- 18. **B** Randomness in token selection means every change comes with a fresh roll. Change one thing at a time and compare across runs.
- 19. **C** A quotation can be searched for in the source in seconds. The other three change tone without creating anything checkable.
- 20. **B** Field is subject vocabulary; tenor is relationship and social distance; mode is channel.
- 21. **B** Field, tenor and mode all specified. The others describe feelings rather than texts.
- 22. **B** The fallback principle: make the honest answer probable rather than appealing to honesty.
- 23. **B** Consistent error looks like reliability. A randomly failing tool would be caught quickly.
- 24. **B** It changes where the answer comes from. It installs no truth check and does not fix a wrong source.
- 25. **C** Absence of a quotation is the signature of answering from memory.

Marking. 4 points per question, 100 points total, taken directly as the 40% midterm component. No negative marking.
