

Prompt Engineering and Large Language Models

Quiz 1

Weeks 1–2: Introduction, Vocabulary, and the History of AI

Name: _____ Student No: _____ Date: _____

Instructions. This paper contains 10 multiple-choice questions. Select the **single best** answer for each. Each question is worth equal marks. Time allowed: 10 minutes. No notes or electronic devices.

1. Which of the following is an example of **generative** AI?
 - A) A bank system deciding whether a transaction is suspicious
 - B) A hospital system deciding which scans a radiologist should read first
 - C) A system that drafts a letter to a patient's family
 - D) A spam filter sorting incoming email
2. In this course, the term **prompt** refers to:
 - A) Only the question you type
 - B) Everything you give the system, including attached documents and images
 - C) The system's internal instructions, which you cannot see
 - D) The first message of a conversation only
3. What is the **context**?
 - A) Everything the model learned during training
 - B) Everything the model can see at the moment it answers you
 - C) The subject area a question belongs to
 - D) The model's permanent memory of your previous conversations
4. A student asks an AI assistant about employment notice periods in Turkey and receives a confident, well-structured answer that actually describes United States practice. Which failure signature is this?
 - A) Fabrication
 - B) Displacement
 - C) Omission
 - D) Overconfidence
5. An AI-generated summary contains a citation in perfect format, attributed to a real journal, for an article that does not exist. Which failure signature is this?
 - A) Fabrication
 - B) Displacement
 - C) Omission
 - D) Silent failure
6. Which failure signature is hardest to detect, and why?

- A) Fabrication, because citations are difficult to check
 - B) Displacement, because foreign law is complex
 - C) Omission, because there is no wrong sentence to point at
 - D) Overconfidence, because the tone is always the same
7. ELIZA (1966) is significant to this course mainly because:
- A) It was the first program to pass the Turing test
 - B) It demonstrated that fluent language alone is enough to produce a sense of being understood
 - C) It was the first system to use neural networks
 - D) It proved that rule-based approaches could scale
8. The “ELIZA effect” describes:
- A) The tendency of chatbots to repeat themselves
 - B) The tendency of people to attribute understanding to a system producing plausible language
 - C) The loss of accuracy when a model is made smaller
 - D) The tendency of models to agree with the user
9. Herbert Simon predicted in 1965 that machines would be able to do any work a human can do within twenty years. What lesson does this course draw from such predictions?
- A) Predictions about AI are always wrong
 - B) The direction of predictions has often been reasonable while the timing has been badly optimistic
 - C) AI progress has been faster than predicted
 - D) Researchers should not make predictions
10. Across the four eras of the field (rules, statistics, neural networks, transformers), what is the constant direction of change?
- A) From smaller models towards larger models
 - B) From English towards multilingual systems
 - C) From human-written specification towards learning from data
 - D) From academic research towards commercial products
