

Answer Key

Quiz 4

Weeks 7–8: Grounding, and Verification

1. **B** Grounding places passages into the context. No retraining is involved — the model is unchanged; only what it can see has changed.
2. **B** Retrieve, augment the context, generate. The phrase describes nothing more elaborate than that.
3. **C** Grounding changes *where* the answer comes from. If the source is wrong or out of date, you now have a confident wrong answer with a citation attached — arguably worse, because the citation makes it more persuasive.
4. **B** A short, fixed, visually obvious string survives skim-reading. “I could not find specific information, however, based on general principles...” is the same admission in a form you will read straight past.
5. **C** No quotation is the signature of answering from memory. If there is no quote, assume memory until shown otherwise.
6. **B** Over-reading: the claim is stronger than the sentence supports. “May” becoming “must” is the classic instance. Compare claim strength against quote strength.
7. **B** Seven answerable — two easy, three medium, two hard — plus three plausible unanswerable ones.
8. **B** In normal use you cannot tell which of your questions are unanswerable, so you never observe this behaviour. Constructing it deliberately is the only way to see it.
9. **B** Writing the expected answer afterwards allows you to accept whatever you got. The order makes the exercise honest.
10. **C** Verification requires something outside the system. Repeating a question measures how common a pattern is; asking the model about its own confidence stays inside the system.
