

Answer Key

Midterm Examination

Weeks 1–7 · 30 questions × 2 points = 60 points

1. **C** Drafting produces new content. Ranking, flagging and detecting all select among existing options.
2. **B** Everything supplied is the prompt, including attachments — the basis for indirect injection in Week 12.
3. **B** Confidence stays flat while knowledge drops. There is no mechanism by which uncertainty could reach the output.
4. **C** Omission — everything present is true; the thing that mattered is absent. Hardest to catch because there is no wrong sentence.
5. **B** If output were obviously bad it would be discarded. It resembles competent professional work, which is why it is trusted.
6. **C** Keyword matching and reflection only. No knowledge, no memory, no model of the conversation.
7. **B** Named in 1966 and still the most common error people make with these tools.
8. **B** The methods produced real working systems. Funding collapsed because of the promise-delivery gap.
9. **C** Every major shift moved work from human specification towards learning from data.
10. **C** Common short words are single tokens; rare technical terms fragment into pieces.
11. **B** Stacked suffixes produce assembled words that appeared rarely, even though each piece is common.
12. **C** Turkish input is processed normally. The costs are context, money and coverage — not refusal.
13. **B** A probability distribution over the vocabulary, from which one token is selected.
14. **B** The same operation runs regardless. A near-certain answer and a guess are produced identically.
15. **B** “I don’t know” is a token sequence like any other, and questions in training text are usually followed by answers. Fine-tuning shifts this tendency but installs no mechanism.
16. **D** Training data is not in the context. The context is what the model can see at the moment of answering.
17. **B** The quiet failure. An error message would be preferable, because it tells you something went wrong.
18. **D** The four levers are Context, Task, Format and Examples. Temperature is a sampling setting, not a lever of prompt design.
19. **D** Correct but lifeless means Examples. Stop describing the tone and show two paragraphs of the real thing.

20. **B** Compound tasks receive a shallow pass at each. Separate turns also let you verify each result before it is built upon.
21. **B** A role sets register and vocabulary — a real effect. Stacked superlatives specify flattery rather than a situation.
22. **B** Randomness in token selection means every change comes with a fresh roll. Change one thing at a time and compare across runs.
23. **C** A quotation can be searched for in the source in seconds. The other three change tone without creating anything checkable.
24. **A** Field is subject vocabulary; tenor is relationship; mode is channel.
25. **B** Field, tenor and mode all specified. The others describe feelings rather than texts.
26. **B** The fallback principle: make the honest answer probable rather than appealing to honesty.
27. **B** Showing beats describing for house style, because the features that define a voice resist description.
28. **B** Consistent error looks like reliability. A randomly failing tool would be caught quickly.
29. **B** It changes where the answer comes from. It installs no truth check and does not fix a wrong source.
30. **C** Absence of a quotation is the signature of answering from memory.

Marking. 2 points per question, 60 points total. Scale to 40 for the course grade (multiply by 2/3). No negative marking.
