

Answer Key

Quiz 1

Weeks 1–2: Introduction, Vocabulary, and the History of AI

1. **C** Generative AI produces new content. Deciding whether a transaction is suspicious is classification; ordering scans is ranking; spam filtering is classification.
2. **B** A prompt is everything you supply, including attached files and images. This matters for Week 12: if you think the prompt is only what you typed, you will not anticipate indirect injection.
3. **B** Context is everything visible to the model at the moment of answering: your message, the conversation so far, attachments, and hidden system instructions. There is no memory outside it.
4. **B** Displacement — correct for another country or context, with nothing fabricated and nothing applicable. This is the most common failure for work in Turkey.
5. **A** Fabrication — a specific invented detail inside an otherwise correct answer. The format of a citation is highly patterned and easy to imitate; the content is not.
6. **C** Omission. There is no false statement to identify, so it can only be caught by someone who already knows what should have been said — which is precisely what you lack outside your own expertise.
7. **B** ELIZA had no knowledge, no memory and no model of the conversation, yet people confided in it. Fluency alone produced the sense of understanding.
8. **B** The ELIZA effect, named in 1966 and still the most common error people make with these tools.
9. **B** The base rate for this field: reasonable direction, badly optimistic timing. Answer A overstates it — the lesson is about calibration, not dismissal.
10. **C** Every major shift moved work away from human specification and towards learning from data. This is the most reliable trend line in the field's history.
