

Prompt Engineering and Large Language Models

Quiz 3

Weeks 5–6: Style, Tone and Format; Building Without Code

Name: _____ Student No: _____ Date: _____

Instructions. This paper contains 10 multiple-choice questions. Select the **single best** answer for each. Each question is worth equal marks. Time allowed: 10 minutes. No notes or electronic devices.

1. Why does the instruction “be professional” produce inconsistent results?
 - A) The model does not understand the word
 - B) It describes a feeling rather than a text, and is compatible with many different outputs
 - C) It is too short to affect the output
 - D) Professional writing is rare in training data
2. In the three dimensions of register, **tenor** refers to:
 - A) The subject matter and its vocabulary
 - B) The relationship between writer and reader
 - C) Whether the text is written or spoken
 - D) The emotional warmth of the text
3. Which of these is a **behaviour** rather than an adjective, and therefore checkable?
 - A) Make it warm
 - B) Make it reassuring
 - C) Use the reader’s name and acknowledge their situation
 - D) Make it feel more human
4. You ask for a table with a “deadline” column, but the source document states no deadline. Without a fallback instruction, what is most likely?
 - A) The cell is left empty
 - B) The system reports an error
 - C) A plausible deadline appears in the cell
 - D) The whole table is refused
5. Why does adding “if a field cannot be filled from the source, write NOT STATED” work?
 - A) It appeals to the model’s honesty
 - B) It makes the honest answer a likely continuation
 - C) It disables the model’s creativity
 - D) It reduces the temperature
6. Which is a well-formed negative constraint?
 - A) Do not be boring
 - B) Do not write badly

- C) Do not use any sentence longer than 20 words
 - D) Do not disappoint the reader
7. When generating a working browser tool from a description, what is actually happening?
- A) The system assembles pre-built components from a library
 - B) The system predicts code, in the same way it predicts prose
 - C) The system searches for an existing tool and copies it
 - D) The system compiles your description into a program
8. Why do generated tools succeed most reliably on ordinary tasks?
- A) Ordinary tasks require less code
 - B) Common tasks appear thousands of times in near-identical form in training data
 - C) The model tests ordinary tasks before returning them
 - D) Ordinary tasks have fewer edge cases by definition
9. A generated tool has a clean interface, working buttons, and produces a confidently formatted number that is wrong every time. Which failure is this?
- A) Silently discarded input
 - B) Correct only for the cases tried
 - C) Wrong logic with right appearance
 - D) Context overflow
10. Which statement best captures the central risk of building a tool you cannot read?
- A) It may be slow
 - B) You can judge whether it looks right, but not whether it is right
 - C) It may stop working when the service changes
 - D) It cannot handle large amounts of data
