

Answer Key

Quiz 5

Weeks 9–12: Agents, Design, Domain Adaptation, and Security

1. **C** With a chatbot you read every output and correct it unconsciously. An agent deletes that free quality control, and most people do not notice they were providing it.
2. **C** $0.95^{10} \approx 0.60$. Every component is excellent and the system fails about two times in five.
3. **B** Errors are inherited rather than averaged away. Step two performs its work on possibly-wrong input, so a mistake early is carried by everything downstream.
4. **B** Silent failure — the characteristic failure of anything multi-step. Nothing errors, and the output is indistinguishable from a correct one.
5. **C** Narrow tools is a wall; everything else is a request. It cannot misuse a capability it was never given, regardless of what it decides.
6. **B** Before the irreversible action, not at the end. Identify the irreversible step first, then place the human relative to it.
7. **B** “A student misses a resit because they were told the wrong date” immediately rules out designs that “users could get wrong information” permits.
8. **C** A Domain Pack makes output usable and more persuasive. It does nothing for correctness — and by making wrong content look professional, it can increase over-trust.
9. **B** You did nothing wrong and never saw the malicious text. Direct injection is someone attacking their own tool; indirect injection is someone attacking you.
10. **B** Instructions and data share one undifferentiated channel. Nothing in the context carries a label marking it trustworthy, which is why this is hard to fix rather than merely neglected.
