

Prompt Engineering Quiz: Week 3 & 4 (Answer Key)

Ankara Medipol University

October 31, 2025

Answer Key

1. **c) Role/Audience**
Explanation: This component sets the persona for the AI and defines who the response is intended for, which controls tone and complexity.
2. **b) Few-shot prompting**
Explanation: Few-shot prompting provides a small number of examples (shots) to guide the model's output style and format.
3. **b) To ground the model's answers in provided, specific context.**
Explanation: RAG connects the LLM to an external knowledge source, ensuring its answers are based on that specific data rather than its general training.
4. **b) Zero-shot Chain-of-Thought (CoT)**
Explanation: This simple phrase encourages the model to "show its work" and output its reasoning process, which often improves accuracy on complex tasks, even without prior examples.
5. **c) They clearly separate instructions from data or context, reducing ambiguity.**
Explanation: Delimiters help the model understand which part of the prompt is the instruction and which part is the content it should work on.
6. **d) Conflicting directives**
Explanation: This is a classic anti-pattern where the prompt gives two mutually exclusive instructions, confusing the model.
7. **d) CO-STAR**
Explanation: CO-STAR is a framework designed to ensure all key components of a good prompt are considered.
8. **b) Frameworks package multiple patterns into a reusable, structured template for a workflow.**
Explanation: Patterns are the individual building blocks (like role or format), while frameworks are the recipes that combine them for a specific purpose.
9. **b) Meta-Prompting**
Explanation: Meta-prompting is the practice of using prompts to reason about or generate other prompts.
10. **c) Generate a structured JSON object specifying a function to be called and its arguments.**
Explanation: The model doesn't execute the tool itself; it signals its intent for your code to run a specific function with specific parameters.
11. **c) Prompt Playbook**
Explanation: A playbook is the most comprehensive asset, detailing an entire process that includes multiple prompts, human checkpoints, and operational guidelines.
12. **b) Adjust**
Explanation: The IDEA loop consists of Identify, Draft, Evaluate, and Adjust, representing a full cycle of prompt refinement.
