

Answer Key — Prompt Engineering Quiz 3

- #1 B** — Constraint Violation. Ignoring negative constraints like "no lists" is a classic constraint failure.
- #2 B** — To ask the model to evaluate its own output against a rubric before revising. This separates the "creation" step from the "editing" step.
- #3 C** — Fragility and inability to fix edge cases. If you don't understand the code generated by "vibes," you cannot maintain it.
- #4 B** — Using a strong model (e.g., GPT-4) to grade the outputs of other models. This scales evaluation without human fatigue.
- #5 B** — Evaluate. This phase checks outputs against requirements before refinement or deployment.
- #6 B** — It is significantly easier to generate text than to verify it. This asymmetry creates the "Evaluation Gap."
- #7 D** — Human-like. The 3 H's are Helpful, Honest, and Harmless.
- #8 B** — A curated set of inputs and "perfect" outputs used as a benchmark for testing.
- #9 C** — Syntax or JSON format compliance. Hard metrics are deterministic and binary (pass/fail).
- #10 B** — Rate longer answers as better, even if they contain fluff. This is a common bias in both humans and LLMs.
- #11 B** — Risk-based sampling. This focuses evaluation effort on high-stakes or new areas.
- #12 C** — Decide which of two responses (A or B) is better. This is often more reliable than absolute scoring.
